Climate Change-Sensitive Water Resources Management

IAHR Monograph

Series editor: Robert Ettema

*Department of Civil and Environmental Engineering,
Colorado State University,
Fort Collins, USA*

The International Association for Hydro-Environment Engineering and Research (IAHR), founded in 1935, is a worldwide independent organisation of engineers and water specialists working in fields related to hydraulics and its practical application. Activities range from river and maritime hydraulics to water resources development and eco-hydraulics, to ice engineering, hydroinformatics and continuing education and training. The IAHR stimulates and promotes both research and its application, and, by doing so, strives to contribute to sustainable development, the optimisation of world water resources management and industrial flow processes. The IAHR accomplishes its goals by a wide variety of member activities including the establishment of working groups, congresses, specialty conferences, workshops and short courses; the commissioning and publication of journals, monographs and edited conference proceedings; involvement in international programmes such as the UNESCO, WMO, IDNDR, GWP, ICSU and The World Water Forum; and by co-operation with other water-related (inter)national organisations. www.iahr.org

About the IAHR Book Series

An important function of any large international organisation representing the research, educational and practical components of its wide and varied membership is to disseminate the best elements of its discipline through learned works, specialized research publications and timely reviews. The IAHR is particularly well-served in this regard by its flagship journals and by the extensive and wide body of substantive historical and reflective books that have been published through its auspices over the years. The IAHR Book Series is an initiative of the IAHR, in partnership with CRC Press/Balkema – Taylor & Francis Group, aimed at presenting the state-of-the-art in themes relating to all areas of hydro-environment engineering and research.

The Book Series will assist researchers and professionals by advancing and transferring contemporary knowledge needed for research, education and engineering practice. The series includes design manuals and monographs. The design manuals, usually prepared by multiple authors, guide the application of theory and research findings to engineering practice, and the monographs give the state-of-the-art coverage of various significant topics in water engineering. The first and highly successful IAHR book was *Turbulence Models and their Application in Hydraulics* by W. Rodi, published in 1984 by Balkema.

Turbulence in Open Channel Flows by I. Nezu and H. Nakagawa, also published by Balkema (in 1993), had an important impact on the field and, during the period 2000–2010, further authoritative texts (published directly by the IAHR) included *Fluvial Hydraulics* by S. Yalin and A. Da Silva and *Hydraulicians in Europe* by W. Hager. All of these publications continue to strengthen the reach of the IAHR and to serve as important intellectual reference points for the Association.

Since 2011, the Book Series has once again been a partnership between CRC Press/Balkema – Taylor & Francis Group and the Technical Committees of the IAHR. The present book is an exciting further contribution to IAHR's Book Series, substantially aiding water engineering research, education and practice, and showcasing the expertise the IAHR fosters.

Acknowledgments

This book is a joint effort of several members of the Leadership Team (LT) of the Water Resources Management Committee and the Committee on Climate Change Adaptation of the International Association for Hydro-Environment Engineering and Research (IAHR). The work for the book was initiated by Dr. Young-Oh Kim, the past chair of the LT of the Water Resources Management Committee. We thank all the primary authors and co-authors of each chapter for their contributions.

Ramesh S. V. Teegavarapu, Elpida Kolokytha,
Carlos de Oliveira Galvão

Editors

Ramesh S. V. Teegavarapu is a professor and graduate program director in the Department of CECE and founder and leader of the Hydrosystems Research Laboratory (HRL) at FAU. His main research interests are in the areas of climate change and variability, hydro climatic extremes, water, and environmental systems management, spatial hydrology and hydrometeorology. He is a recipient of several national and international awards including Fulbright Scholar, Fulbright Specialist and awards from the American Society of Civil Engineers (ASCE), British Hydrologic Society (BHS), NSERC Canada. Dr. T. has worked as international visiting professor at Kobe University, Japan University of Brescia and Politecnico Di Torino, Italy, in the last four years and lectured in workshops/conferences, gave invited talks and keynote lectures in 18 countries. Dr. T. has published over 120 technical articles in high impact journals and conference proceedings and authored 25 book chapters, 5 mini-chapters and is an author, co-editor, sole-editor of several books from multiple reputed international publishers. He is a contributing member and lead member of several international technical committees and served as a thesis committee member for over a dozen international doctoral dissertations. Personal Web Site: <http://faculty.eng.fau.edu/ramesh>; Lab Web Site: <http://hrl.fau.edu>.

Carlos de Oliveira Galvão is a professor at the Department of Civil Engineering at the Federal University of Campina Grande (UFCG), Brazil. He has over 35 years of research experience in the fields of experimental-basin hydrology, climate change and water resources, rainwater harvesting, and water resources management. He is currently a member of the Leadership Teams of the The International Association for Hydro-Environment Engineering and Research's (IAHR's) Technical Committee on Water Resources Management and of the Sustainable Development Goals Working Group. Prior to his tenure at UFCG, he was a researcher at the Brazilian Corporation for Agricultural Research (EMBRAPA).

Elpida Kolokytha is a professor at the Department of Civil Engineering, Aristotle University of Thessaloniki (AUTH), Greece. She has 25 years of research experience, together with coordination skills, in the field of environmental policy, integrated water resources management and climate change, socio-economic aspects of water resources, national, European and International legislation of water resources as well as transboundary river basin management. She has published more than 100 papers in scientific journals and conference proceedings, and she is a member of several scientific associations related to water resources management and engineering worldwide. She is currently the chair of the Leadership Team of the IAHR's Technical Committee (TC) on Water Resources Management and member in TC in Climate Change Adaptation and at the Sustainable Development Goals Working Group. She is also the director of the UNESCO Center for Integrated and Multidisciplinary Water Resources Management at AUTH.
