

Lecture 06

Probability, Statistics, Uncertainty, and Stochastic Simulations

Part I

Review on Previous Lectures

- ❖ Lec 03-04: Introduction to Conventional Optimization Models
 - ◆ Nonlinear Optimization Models, LP, DP
- ❖ Lec 05: Data-fitting, Evolutionary Optimization Models
 - ◆ EA: Evolutionary Algorithms (진화 알고리즘)
 - ◆ GA: Genetic Algorithms (유전 알고리즘)
 - ◆ GP/EP: Genetic Programming/Evolutionary Programming (유전 프로그래밍/진화 프로그래밍)
 - ◆ ANN: Artificial Neural Networks (인공 신경망)
 - ◆ DE: Differential Evolutions (차분 진화 알고리즘)

 - ◆ EMODPS: Multi-objective Direct Policy Search (진화적 다목적 직접 정책 검색법)

Today's Topic: Probability, Statistics, Uncertainty and Stochastic Simulations

- ❖ Why does Uncertainty (불확실성) occur in WRSA?
 - ◆ Difference in the timing of Design, Building & Operation
 - Time variability & change (Blöschl et al. 2019)
 - ◆ Stochastic (randomness over time) nature of meteorological and hydrological processes such as rainfall and evaporation

- ◆ How to deal with Uncertainty?
 - Simplest approach = Replacing with representative values (대표값)
 - Mean (expected values), median, worst-case values, etc. ...
 - However, can create a poor representation of both the average performance & the possible performance range

- ❖ Probability & Statistics

Review on Common Representative Values

❖ Basic Probability Concepts

1) Measures of Central Tendency

- Arithmetic Mean (expected values)
- Median (중앙값)
 - => useful for describing central tendency regardless of skewness (less sensitive to outsiders)
- Mode (최빈값)

$$\bar{X} = \sum_{i=1}^n \frac{x_i}{n}$$

$$\hat{X}_{0.5}$$

1, 3, 3, 6, 7, 8, 9

Median = **6**

1, 2, 3, 4, 5, 6, 8, 9

Median = (4+5) / 2 = **4.5**

Review on Common Representative Values

❖ Basic Probability Concepts

2) Measures of Dispersion: Describes the spread of data

◆ Examples include:

- Range: X_{max} & X_{min} (관측값중 가장 큰 값 & 가장 작은 값)
- Quartiles & Interquartile Range
- Variance (Standard Deviation)

The diagram shows three normal distribution curves labeled A, B, and C. Curve A is the tallest and narrowest, representing the lowest variance. Curve B is shorter and wider than A. Curve C is the shortest and widest, representing the highest variance. All three curves are centered at the same point on the horizontal axis.

$$S^2 = \sum_{i=1}^n \frac{(x_i - \bar{x})^2}{n-1}$$

Review on Common Representative Values

❖ Basic Probability Concepts

3) Measure of Asymmetry

- Coefficient of Skew

$$G = \frac{\tilde{M}_3}{S^3}$$

Using the 3rd moment and the standard deviation,

$$\tilde{M}_k \equiv \sum_{i=1}^n \frac{(X_i - \bar{X})^k}{n} \quad \text{and} \quad S \equiv \sqrt{S^2}$$

Review on Common Representative Values

❖ Basic Probability Concepts (Data observed in Pairs)

4) Measure of Correlation (Relation between two random variables)

- Linear Correlation Coefficient

$$\text{Correl}(X, Y) = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sqrt{\sum (x - \bar{x})^2 \sum (y - \bar{y})^2}}$$

$$\text{Correl}(\text{Rainfall}, \text{Runoff}) = 0.91$$

Summary (1)

❖ How to deal with Uncertainty?

- ◆ Simplest approach = Replacing with representative values (대표값)
- ◆ Mean (expected values), median, worst-case values, etc. ...
- ◆ However, can create a poor representation of both the average performance & the possible performance range

❖ Common Representative Values for:

- 1) Measures of Central Tendency: mean, median, mode
- 2) Measures of Dispersion: range, IQR
- 3) Measure of Asymmetry: coefficient of skew
- 4) Measure of Correlation: linear correlation coefficient

Explain the data with Rep. Values?

❖ No! Proof?

Justin Matejka, George Fitzmaurice (2017). Same Stats, Different Graphs: Generating Datasets with Varied Appearance and Identical Statistics through Simulated Annealing CHI 2017 Conference proceedings: ACM SIGCHI Conference on Human Factors in Computing Systems

Concept of Probability

❖ Random variables & Distributions

◆ Random variables (RVs, 확률 변수 = stochastic variable):
function whose value cannot be predicted with certainty

- For instance, let X denote a random variable,
and x a possible value of the random variable X
- Types of RV: Discrete RV // Continuous RV
 - Examples?
 - ✓ Coin Toss
 - ✓ Height
 - ✓ Weight
 - ✓ Dice Roll

❖ If X is a discrete random variable,

❖ If X is a continuous random variable,

❖ In case of joint probability distribution of X and Y ,

Review on the Probability Concepts

Fig. 6.1 Cumulative distribution and probability density or mass functions of random variables: **a** continuous distributions; **b** discrete distributions

Mean, average, or
expected value

$$\bar{X} \equiv \sum_{i=1}^n \frac{X_i}{n}$$

Variance

$$S^2 = \sum_{i=1}^n \frac{(X_i - \bar{X})^2}{n-1}$$

k th central moment

$$\tilde{M}_k \equiv \sum_{i=1}^n \frac{(X_i - \bar{X})^k}{n}$$

Standard deviation

$$S \equiv \sqrt{S^2}$$

Coefficient of variation
or relative standard
deviation (if $\mu \neq 0$)

$$CV \equiv \frac{S}{\bar{X}}$$

Coefficient of skew (a
measure of asymmetry)

$$G \equiv \frac{\tilde{M}_3}{S^3}$$

Quantiles

$\hat{X}_p$ is the p th quantile of edf

Median (useful for
describing central
tendency regardless of
skewness)

$$\hat{X}_{0.5}$$

The middle observation in a sorted
sample, or the average of the two
middle observations if the sample
size is even.

Summary (2)

Cumulative distribution
function (cdf)

Empirical distribution function (edf):
describes the observed frequency
of a random variable being less
than or equal to a specified value x

Probability mass
function (pmf) and
probability density
function (pdf)

Histogram: observed frequency
with which random variable X
falls into the assigned ranges

Common Distributions in WRSA

Uniform distribution

$$f(x) = \frac{1}{B-A} \text{ for } A \leq x \leq B$$

$$F(x) = \int_{-\infty}^x f(x) dx = \frac{x-A}{B-A} \text{ for } A \leq x \leq B$$

$$E(X) = \frac{A+B}{2} \quad \text{Var}(X) = \frac{(B-A)^2}{12}$$

Normal distribution

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right) \text{ for } -\infty \leq x \leq \infty$$

$$F(x) = \int_{-\infty}^x f(x) dx$$

must be evaluated numerically

$$E(X) = \mu \quad \text{Var}(X) = \sigma^2$$

More on the Normal Distribution

$$X \sim N(\mu_X, \sigma_X)$$

- ❖ Most commonly used distribution
- ❖ Many variables in nature are normally distributed
- ❖ Fully described by two parameters:
mean (μ_X) and standard deviation (σ_X)
- ❖ The mean = the median
- ❖ Central Limit Theorem (CLT)-
the sum of a large number of individual random components
tends to be a normal distribution

Many random variables in nature follow a normal distribution

Standard Normal Distribution

A normal distribution with parameters $\mu = 0$ and $\sigma^2 = 1$ is known as the *standard normal distribution*

$$f_Z(z) = \frac{1}{\sqrt{2\pi}} e^{-(1/2)z^2}$$

$$F_Z(z) = \int_{-\infty}^z f_Z(z) dz$$

→ Solved numerically and results widely tabulated
 $\Phi(z_i) = F_Z(z_i) = P(z < z_i)$

Transforming into Standard Normal Dist.

$$z = \frac{x - \mu}{\sigma}$$

"Standard Normal Variate"

We use this equation to *normalize* x - in other words to find the value of z such that

$$F_X(x) = F_Z(z)$$

68-95-99.7 rule for a Normal Distribution

Example Problem: Annual Precipitation

- 1) Sketch the histogram
- 2) Calculate μ and σ
- 3) Assume a normal distribution
 - is this reasonable?
- 4) What is the probability that the annual precipitation this year will be greater than 1100 mm?

Annual precipitation for a ten-year period	
Year	Annual Precipitation (mm)
1975	1020
1976	987
1977	894
1978	1040
1979	995
1980	780
1981	1004
1982	930
1983	1192
1984	950

Example Problem: Annual Precipitation

- 1) Sketch the histogram
- 2) Calculate μ and σ
- 3) Assume a normal distribution
- is this reasonable?
- 4) What is the probability that the annual precipitation this year will be greater than 1100 mm?

$$\mu = 979.2 \text{ mm} \quad \sigma = 106.3 \text{ mm}$$

Example Problem: Annual Precipitation

4) What is the probability that the annual precipitation this year will be greater than 1100 mm?

$$\mu = 979.2 \text{ mm}, a = 1100 \text{ mm } \sigma = 106.3 \text{ mm}$$

$$z = \frac{a - \bar{x}}{s} = \frac{1100 - 979}{106} \cong 1.14$$

$$F(z) = F(1.14)$$

$$F(1.14) = 0.8729$$

$$\text{Answer: } 1 - F(z) = 0.1272$$

Or less than a 12.71% chance

Finally, Conditional Probability $P(A|B)$

4. Conditional probability

Probability of occurrence of event **A** given that event **B** has already occurred is defined as:

$$P(A|B) = \frac{P(A \cap B)}{P(B)}$$

or

$$P(A \cap B) = P(B)P(A|B) = P(A)P(B|A)$$

If $P(A|B) = P(A)$ then the events are said to be **statistically independent**

Example:

For daily rainfall in Ashland, Kentucky it is known that the conditional probability for a wet day (W) following a dry day (D), $P(W|D) = 0.444$ (this is also called a transition probability).

Similarly:

- $P(W|D) = 0.276$
- $P(D|D) = 0.724$
- $P(D|W) = 0.556$

What is the probability that a wet day is followed by two more wet days?

Let A be the event that day 2 is wet and B be the event that day 3 is wet. Then

$$P(A \cap B) = P(W|W)P(W|W) = 0.444^2 = 0.197$$

Bayes Theorem

❖ The basics

◆ *a priori* uncertainty + new information

- Yields revised assessment of uncertainty
- Multiple observations—use repetitions of Bayes Theorem

Bayes Theorem

$$P(E|O) = P(E) \left\{ \frac{P(O|E)}{P(O)} \right\}$$

P(E) = Prior probability of event E

P(E|O) = Posterior probability of event E given observation O

P(O|E) = conditional probability of the observation O and the event E

P(O) = Probability of making observation O

❖ $P(E/O)$

- ◆ Read “probability of event E conditional on O having been observed”
- ◆ New information in estimate

❖ $P(O/E)$

- ◆ Frequency that observation O is associated with existence of specific event E
- ◆ Ex: probability of observing salt domes when there is oil

❖ $P(E/O) \neq P(O/E)$ these probabilities are not symmetric!

- ◆ $P(O = \text{male} / E = \text{king}) = 1.0$
- ◆ $P(E = \text{king} / O = \text{male})$ is probability of finding a king given the observation an individual is male = $\sim 10^{-9}$

❖ $P(O)$

- ◆ Probability of making a specific observation O considering all ways it can occur
- ◆ The probability of making observation O may be associated with all possible events E_i

$$P(O) = \sum_i P(O | E_i) P(E_i)$$

Bayes Theorem: Derivation

According to conditional probability,

$$P(E|O) = \frac{P(E \cap O)}{P(O)} \quad \text{The fraction of ellipse B that overlaps with ellipse A}$$

and

$$P(O|E) = \frac{P(E \cap O)}{P(E)} \quad \text{The fraction of ellipse A that overlaps with ellipse B.}$$

Solving for $P(A \cap B)$, the common factor:

$$P(E \cap O) = P(E)P(O|E) = P(O)P(E|O)$$

Rearranging to give $P(A|B)$:

$$P(E|O) = \frac{P(E)P(O|E)}{P(O)} \quad \text{Note: one can reverse E and O and the solution is still valid}$$

Example Problem: Bayes Theorem

❖ In the United States, approximately 1 in 100 otherwise healthy people has Celiac Disease¹. A new diagnostic test, has a 95% reliability, i.e., 95% of people with Celiac test positive, and 95% of people without Celiac test negative. During trials, a randomly selected person tests positive.

- (a) What is the probability that the person has Celiac Disease?
- (b) What is the probability that the person doesn't?

Example Problem: Bayes Theorem

(a)

$$P(\text{Celiac}|\text{Positive}) = P(\text{Celiac}) \frac{P(\text{Positive}|\text{Celiac})}{P(\text{Positive})}$$

$$\begin{aligned} P(\text{Positive}) &= P(\text{Positive}|\text{Celiac})P(\text{Celiac}) \\ &+ P(\text{Positive}|\text{Healthy})P(\text{Healthy}) \\ &= \frac{95}{100} \frac{1}{100} + \frac{5}{100} \frac{99}{100} = 0.059 \end{aligned}$$

$$\begin{aligned} P(\text{Celiac}|\text{Positive}) &= P(\text{Celiac}) \frac{P(\text{Positive}|\text{Celiac})}{P(\text{Positive})} \\ &= 0.01 \frac{0.95}{0.059} = 0.161 \end{aligned}$$

Example Problem: Bayes Theorem

(b)

$$P(\text{Healthy}|\text{Positive}) = P(\text{Healthy}) \frac{P(\text{Positive}|\text{Healthy})}{P(\text{Positive})}$$

$$\begin{aligned} P(\text{Positive}) &= P(\text{Positive}|\text{Celiac})P(\text{Celiac}) \\ &+ P(\text{Positive}|\text{Healthy})P(\text{Healthy}) \\ &= \frac{95}{100} \frac{1}{100} + \frac{5}{100} \frac{99}{100} = 0.059 \end{aligned}$$

$$\begin{aligned} P(\text{Healthy}|\text{Positive}) &= P(\text{Healthy}) \frac{P(\text{Positive}|\text{Healthy})}{P(\text{Positive})} \\ &= 0.99 \frac{0.05}{0.059} = 0.839 \end{aligned}$$

Rare observations (patient with disease),
and very high or very low association with
event yield strong revisions!

Tips for the TEST (2022 Spring WRSE)

❖ Closed Book, 150 mins, Calculators allows

◆ Exact Time & Place: May 17 화요일, 17:00-19:30, 35-431

❖ 출제 범위

◆ Primary Textbook Chapters

- 01, 02, 03, 04, 05, 06-(6.2.3, p.223 까지 출제범위)

◆ Lecture Notes: 01, 02, 03, 04, 05, 06

◆ Assignments: #1, #2

◆ Quizzes: #1, #2

◆ Other New Questions (1 Question, 2 Questions Max)

Future Schedule (~End of Course)

- ❖ May-17 (1): TEST
- ❖ May-24 (2):
 - ◆ Lec 07: Probability, Statistics, Uncertainty, and Stochastic Simulations
 - ◆ Lec 08: Performance Criteria
- ❖ May-31 & Jun-07 (3 & 4)
 - ◆ Lec 09: Water Resources Systems Engineering Frontiers
-Introduction and Examples Part 1
 - ◆ Lec 10: Water Resources Systems Engineering Frontiers
-Introduction and Examples Part 2 (*Invited Talk*)
- ❖ Jun-14: Final Project Presentation + Report Due (5)
 - ◆ Report는 추후에 기술기사로 출판할 예정 (6-7월 중)
